

Sometimes Floating Luxuries Kai in-pool products require a stronger cleaning. There can be many causes of the water staining your Kai Shelf Lounger; mostly it is from various elements in the water. Sometimes it is caused by minerals, pH balance issues, sunscreen lotion, or simply some dirt in the water from natural sources. But here's the good news, even seemingly hard to remove stains can be removed relatively easily if you follow these instructions. If you have stains that are stubborn, we recommend Bio-Dex 300 Tile Cleaner from Bio-Dex Laboratories. It is available from many pool supply dealers as well as on Amazon. To use Bio-Dex 300 first read all the safety precautions on the plastic bottle it comes in. Drain your Kai Shelf Lounger, then remove it from the pool.

WARNING: Follow all precautionary instructions that come with the Bio-Dex 300. It is a strong chemical and Personal Protective Equipment (PPE) is required to be used to keep you safe. Please see the instructions on the bottle for the equipment that is needed. Rubber gloves and safety glasses must be used along with any other precautions called out on the bottle.

In a well-ventilated area, and not on a surface that could stain or discolor, and using the proper protective equipment, apply Bio-Dex 300 to a soft scrubbing pad and then apply to the areas that are stained. The Bio-Dex works best when it can sit on the stain for 1-5 minutes. After 1-5 minutes, scrub the chair in the stained areas using a circular motion. Rinse the chair with a large amount of fresh water taking care to wash all of the Bio-Dex off the chair. If a second application is needed this may be done. Repeat as necessary when stains appear on the loungers.
